

Ivermectin Cuts Indonesia Covid By 98%, Aussie Cases UP 500% With Lock-N-Vax

By Jo Nova, joannenova.com.au Principia Scientific.com, 12 November 2021

When we last looked at Indonesia their massive wave in Covid cases had just peaked after ivermectin was approved again on July 15th. Since then the cases have dropped from 50,000 a day to about 900. On a per capita basis today Indonesia is managing Covid about *ten times better than Australia*. Think about that.

Remember the reason for the Indonesian surge. In June, they had a controlled rolling caseload of 5,000 a day. It was not rising thanks to a philanthropist called Haryoseno who had been arranging for ivermectin supplies at low cost to help people.

But in a fit of modern-medicine, in line with the deadly WHO recommendations, the Indonesian government banned ivermectin on June 12th. Cases took off. Mayhem ensued. And about 90,000 people died in the following surge.

By early July the **anti-parasitic drug ivermectin was hot property in Indonesia**, even if it was banned. A number of high-ranking politicians championed it, and people were flocking to buy it.

“Indonesians have ignored health warnings to stock up on a “miracle cure” for COVID-19 backed by leading politicians and social media influencers, as an out-of-control virus surge sweeps the country.” — July 8th, NDTV

By July 15th the Indonesian government relented, and **BPOM approved Ivermectin as Covid-19 Therapeutic Drug**. By July 18th new daily cases peaked across Indonesia and now they are lower than they were before. During the surge, at least two million Indonesians were infected.

Perhaps Governments shouldn't run around banning a wonder drug so safe that researchers in **Australia feed it to small children to kill head lice**.

Google Trends show Indonesians were **searching for ivermectin** in early July. The average Indonesian apparently knows more about treating Covid than our Minister of Health. More even than our Chief Medical Officer.

Greg Hunt could have managed the Covid debacle so much better if he'd just phoned up a pharmacist in Bali.

Compare The Rich-Mans Vax Plan

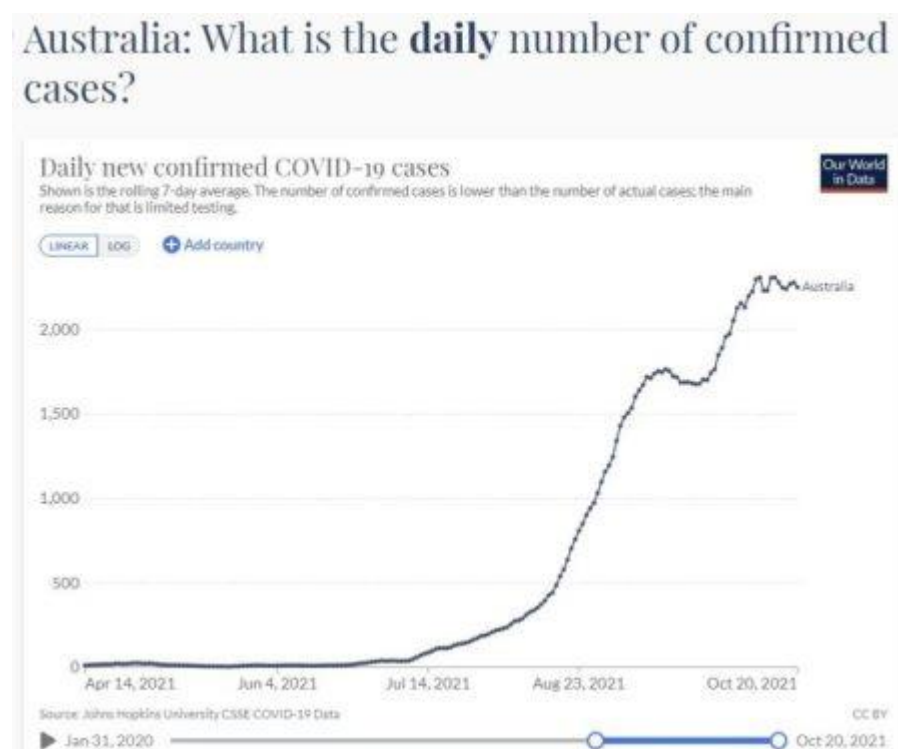

Australia, on the other hand, decided to vaccinate 15 million people or 70% of the entire population and still has twice as many cases as Indonesia does — even though Indonesia has ten times as many people and only on third of the government revenue.

The Australian TGA committee banned ivermectin on Sept 11th, by the way, possibly to make sure we didn't accidentally eliminate Covid, or Pfizer's third quarter profits. Who can tell?

That lockdown-and-vax plan and the roadmap to freedom doesn't seem to be working too well. In Australia billions of dollars were burnt at the stake, not to mention the health risks of using experimental prophylactics, while Indonesia reduced Covid cases by 98% for about point-one percent of the cost and the main side effects were the deaths of worms, lice and bed bugs.

If Gladys had just dished out the Ivermectin — Uttar Pradesh style — on July 5th, the outbreak would have been over in a few weeks.

Since July 18th when Indonesia cases peaked, Australian cases have grown from 31,000 to 150,000.

The only thing more scary than the Ministry of Health's incompetence is that politicians and philanthropists in the third world have more freedom than Australian ones do. The Indonesian media is more worth watching than the Australian ABC.

At this point people are still dying who could be saved.

As David Archibald says *"It means that Australia could end its covid problem anytime it wanted to at hardly any expense at all. Our government would be aware of what the*

Indonesians have achieved. It also means that any covid deaths from here on are state-sanctioned murder. “

The Wonder Drug That Disappeared

My summary of Ivermectin

If you only email friends one link — make it this story. ***It's the biggest medical scandal since 1850— Why is a cheap safe drug being ignored?*** Could it be that there would be no medical emergency and no need to rush out other riskier new treatments which are still classed as “experimental” if there was a safe alternative? There are billions of reasons to ask this question but newspapers wouldn't publish the story.

In desperation, some Americans are going to court to get rulings to order doctors to use Ivermectin on their loved ones. Even if they win, sometimes hospitals still refuse to use it on patients with few options left. One family hired a helicopter to take their mother away from intensive care in a hospital that refused to give Ivermectin (and had a happy ending). The debate is so suppressed, there are rumours the US President was treated with it in secret last year.

For peer reviewed studies read: **The BIG Ivermectin Review: It may prevent 86% of Covid cases.**

Ivermectin has also been used, with apparent success in India, Peru and **Mexico** (and so many other places). **Covid cases fell in the states of India that approved Ivermectin use but rose in Tamil Nadu where it wasn't permitted.** Despite the success, **India's Health dept suddenly stopped Ivermectin use again and people in India are suing the WHO in disgust. In Peru, Ivermectin cut covid deaths by 75% in 6 weeks.**

The FDA and others will say there is little evidence of success so far, but that's a scandal in itself. Why are there no large trials? And why are other drugs like Remdesivir approved with only one trial? Ivermectin is so safe some 3.7 billion doses have already been used around the world. The inventors won a Nobel Prize for its discovery in 2015.

We've known it might be useful since April last year, when an Australian group searched through many cheap safe drugs looking for any that might help against Covid. The news then was **“Another possible cure for coronavirus, found in sheep dip: Ivermectin”.** This was just a lab study, and it suggested doses would need to be too high.

Even so, successes keep turning up in the real world? By July last year there were already signs **Ivermectin could save as many as 50%.** *Why were large trials not started then? The UK trial is hobbled from the start.*
